

IT'S SUNNY, HAVE YOU SEEN A BIGFOOT?

SINCE 1869...
There has been 5,021 reports of Bigfoot. A majority of people have discounted these sightings as misidentifications. Did the weather at the time affect or contribute to the misidentification? Or did they truly see It...

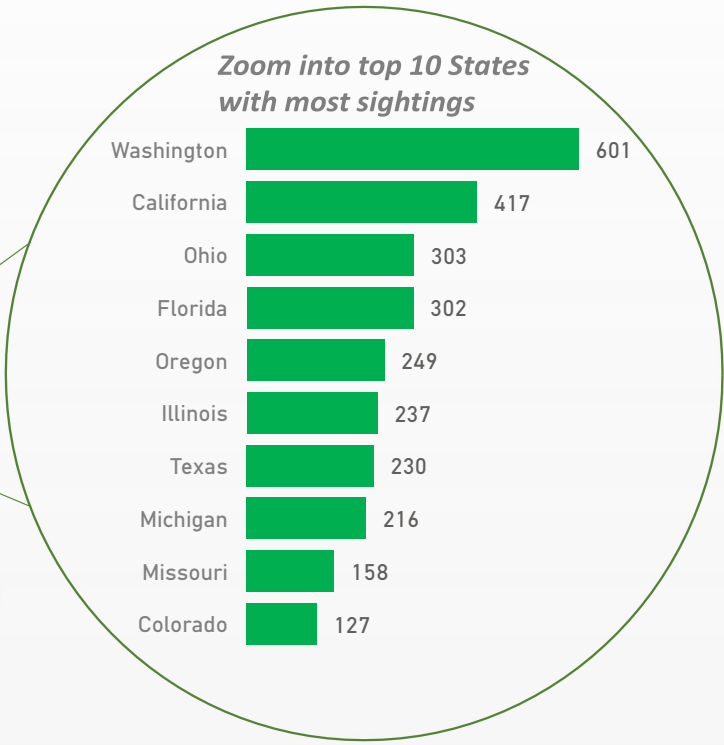

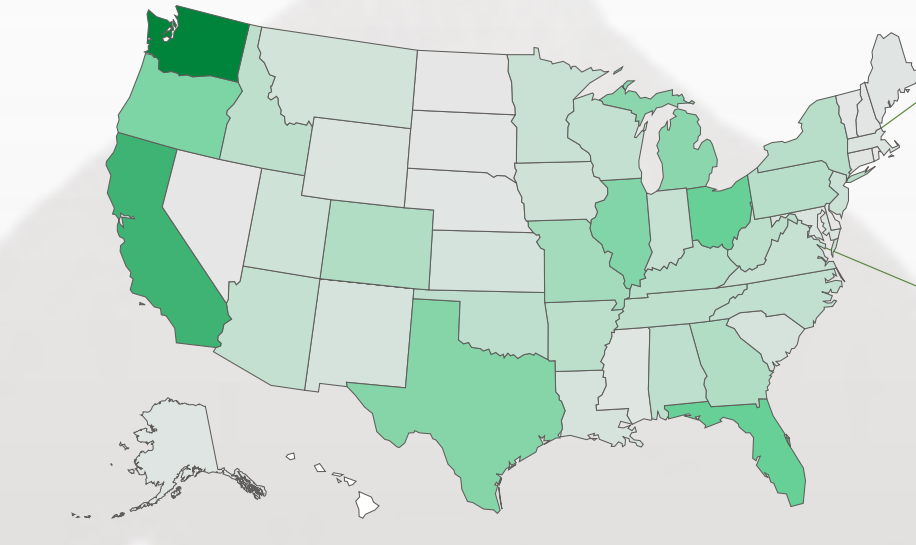

SUMMARY OF BIGFOOT SIGHTINGS OVER THE YEARS

MORE SIGHTINGS OVER THE YEARS
Bigfoot sightings continue to rise and peaked at 2014 with 241 sightings that year. These sightings have been recorded across different states but predominant in Washington and California.

Sightings by Year

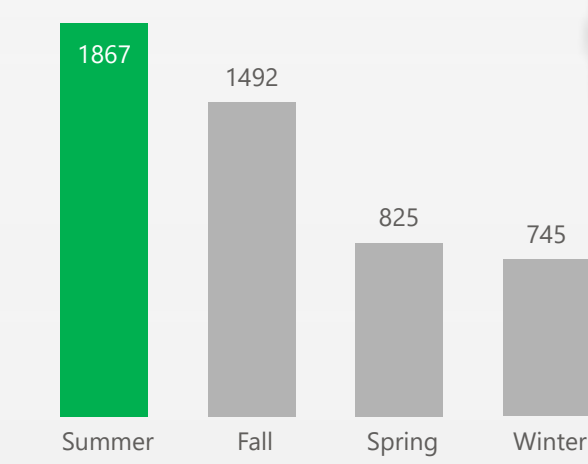

Sightings by States in the U.S

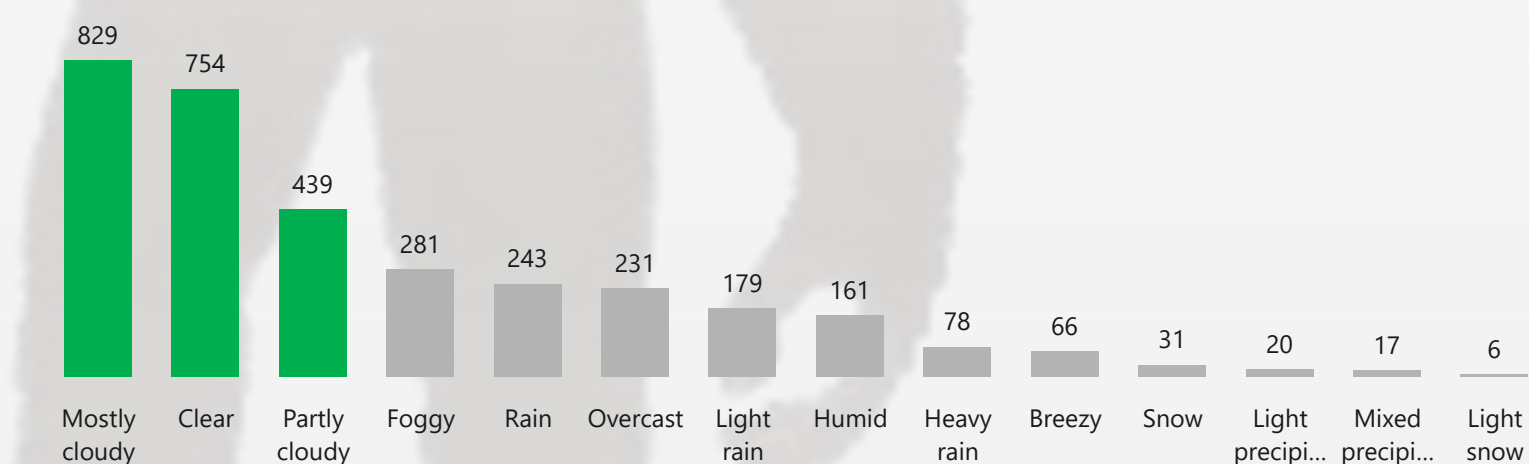

UNDER WHAT WEATHER CONDITIONS WERE THESE SIGHTINGS REPORTED?

SEASONS OF THE YEAR AND ATMOSHERIC CONDITIONS
There were more sightings during the hot seasons of the year and reduced sightings during the cold periods of the year. Despite a lot of sightings during a cloudy day, there is almost as much sightings during a clear day.

Sightings by the different seasons

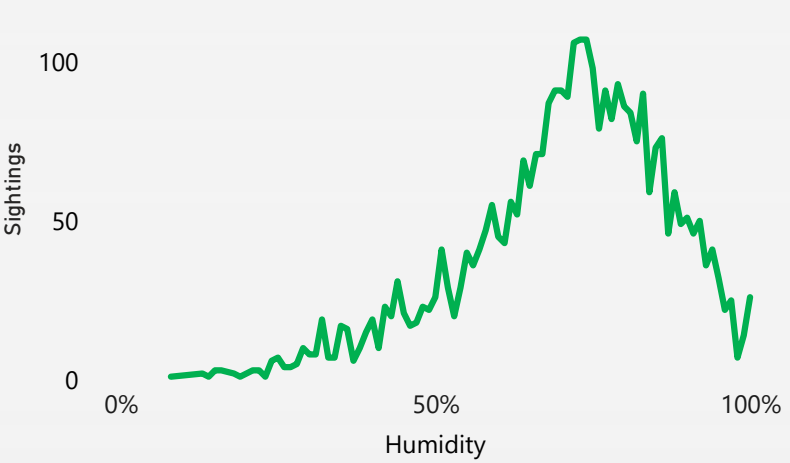

What was the weather condition during sightings

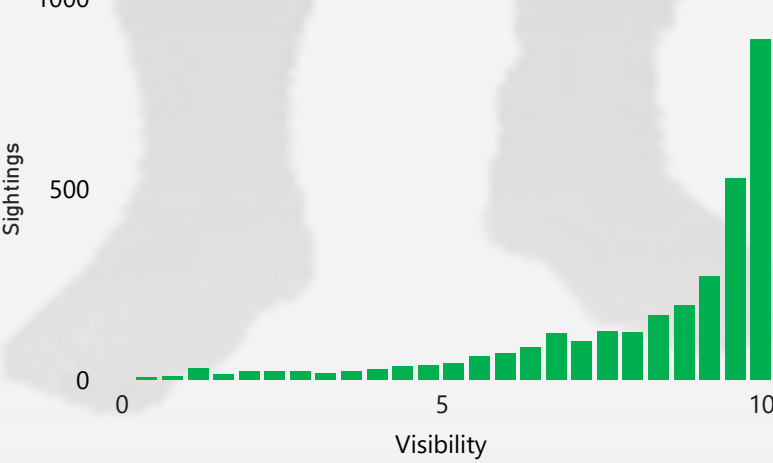

OTHER WEATHER FACTORS
More Big foot sightings were recorded when visibility was high and less windy times. When atmospheric humidity is moderate, there are more sighting report than during very humid conditions and very low humid conditions

Sightings By Wind speed (mph)

SUMMARY OF FINDINGS

The notion that bad weather could have misled people into thinking they saw bigfoot may not be 100% valid because a lot of the sightings were during the summer, less windy atmosphere, a clear sky and when visibility is high. So, the next time you go out on one of the days of the summer months, and you notice the sky is clear, atmosphere is not too humid and wind speed is low, who knows, you might just see a sasquatch.
